

GitHub Team Workflow Guide

Easy & Conflict-Free Collaboration Plan for Your Project Team

1. Understanding Branches

- main = final stable version of your project.
- dev = testing/integration branch where all team code combines.
- personal branches = each member's own workspace.
- Never directly code on main.

2. Branch Structure

- main
- dev
- nimar-features
- ayush-frontend
- rohan-backend
- prabh-debug

3. Member Responsibilities

- Nimar → Attendance, Leave, Projects, AI, Notifications.
- Ayush → Entire frontend (UI, pages, dashboard, forms).
- Rohan → Backend core (Auth, Employee, Payroll, DB schemas).
- Prabh Deep → Final integration, debugging, deployment.

4. Daily Workflow for Each Member

- Step 1: Start your day by pulling latest dev branch.
- Command: `git checkout your-branch`
- Command: `git pull origin dev`
- This gives you the latest code from everyone.

5. Work on Your Assigned Files Only

- Nimar touches feature-specific backend files only.
- Ayush touches frontend only.
- Rohan touches backend core files only.
- Avoid editing someone else's area unless discussed.

6. Save Your Work

- After completing tasks:
- `git add .`
- `git commit -m 'your changes'`
- `git push origin your-branch`

7. Merge into dev

- At the end of the day, merge your branch into dev.
- This combines your code into one testing branch.
- Other members will pull this next day.

8. How Others Get Your Code

- No automatic update happens.
- Each member must pull manually.
- Command: `git pull origin dev`

9. How Conflicts Happen

- Conflict happens only when 2 people edit the same file/line.
- Avoid overlap by clear ownership.

10. Conflict Prevention Rules

- Pull dev every morning.
- Push your work every night.
- Merge into dev daily.
- Never hold code for many days.
- Talk before editing shared files.

11. Prabh Deep Workflow (Day 5-6)

- Pull latest dev into prabh-debug branch.
- Integrate everything.
- Fix conflicts.
- Test all modules.
- Deploy final project.

12. Final Flow Summary

- Personal Branch → dev → main
- Work → Push → Merge → Pull → Repeat
- Final tested code goes from dev to main.
